Troubleshooting the Epson TM-20 Rechargeable Thermal Printer (U220) ePos Solutions - Tep 220MC - Epson's Thermal Printer Printer not working - Epos Receipt Printer not Printing Print Setup.The invention is generally related to inductive couplers, and in particular to an inductive coupler comprising at least one magnetizable core with three cross-sections and at least one coil arranged between and in proximity of the core cross-sections. Inductive couplers are increasingly used in a plurality of applications. In order to improve the signal-to-noise ratio, known couplers comprising at least two cores of magnetizable material are arranged on opposite sides of a coil connected to an amplifier. In so-called “hybrid” couplers, the two cores have cross-sections of circular or elliptical shape and are separated by a short, narrow gap. U.S. Pat. No. 4,570,871 discloses an inductive coupler comprising a magnetic element which is made up from two parts that are positioned relative to each other in the manner of a roof tile and are joined to each other. This inductive coupler has the disadvantage that the cores are not movable and that the magnetic fields generated by the coil are mutually influencing only at their joining line. U.S. Pat. No. 5,451,349 discloses another inductive coupler having a core which is provided with a plurality of concentric, axially separate slots with a common width. This inductive coupler has the disadvantage that the magnetic field is influenced by the outer coil at every location and that the coupling is in practice limited to approximately half of the core width. U.S. Pat. No. 5,742,100 discloses still another inductive coupler which can be used in a plurality of applications. This inductive coupler has a core which comprises a cylindrical shell with a plurality of mutually separate magnetizable elements. A single coil is arranged in a radial inner part
